Microsoft Power BI is a software program for Interactive Data Visualization with a strong emphasis on Business Intelligence. Power BI is a collection of software services, programs, and links that combine to turn unrelated data from various sources into coherent, aesthetically pleasing, and interactive insights. With Power BI Desktop, you can connect to the world of data, create foundational reports that are appealing, and share your work with others so they can build on it and advance your business intelligence initiatives.

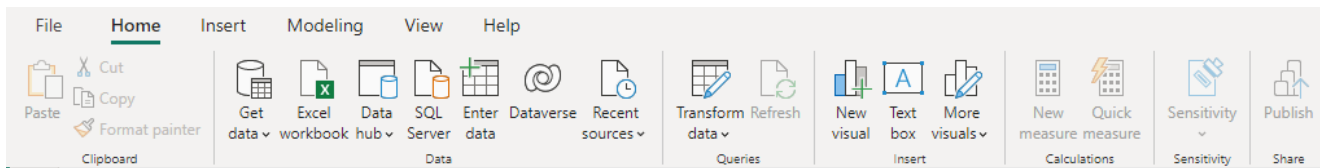

Users can import and reshape data from a number of Microsoft applications, including Excel, Power BI, Analysis Services, Data verse, and others using Power Query, data connectivity, and data preparation tool. You can use Power Query in Power Query Editor to generate new columns whose values depend on one or more criteria that have been applied to existing columns in your table.

How to seek Power Query Editor?

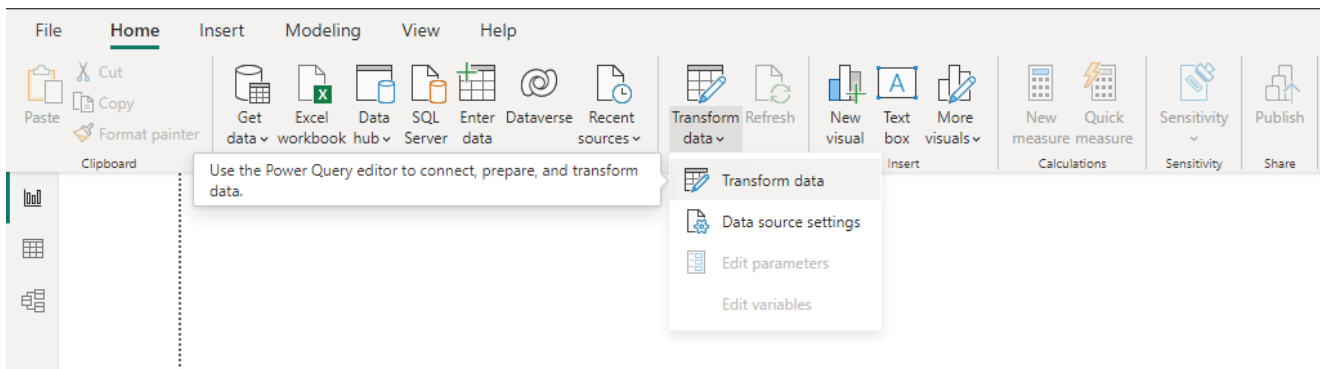

The Data Table used in the article has been formed from the [Dataset](#) of a Library Supplies company. Below is the screenshot of the dataset as well.

Order No.	Order Date (dd-mm-yy)	Client Name	University/ College	Client District	Client State	Client Pin Code	Book No.	Book Sr. No.	Book Date (dd-mm-yy)	Product Name	Product Description

If you are witnessing the below-shown interface of the Power BI Desktop then you need to open the Power Query Editor window.

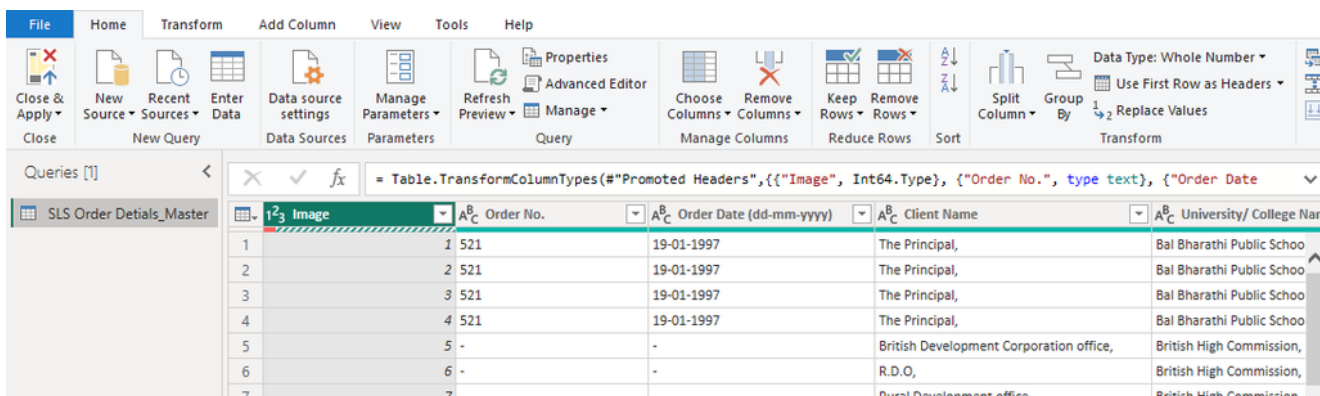

Go to the Transform data Tab and select Transform data.

A new Power Query Editor window would be displayed, where you can Add Upload the dataset by selecting New Source.

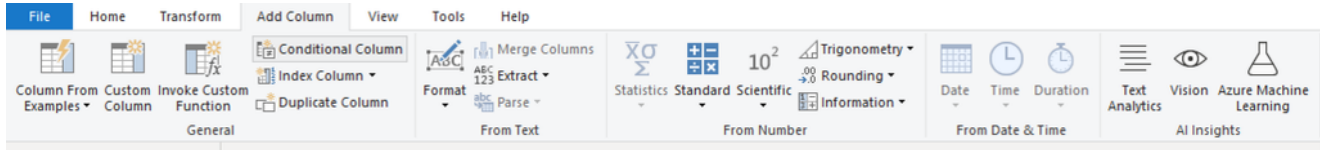

Data Table will be created in Power Query Editor as follows-

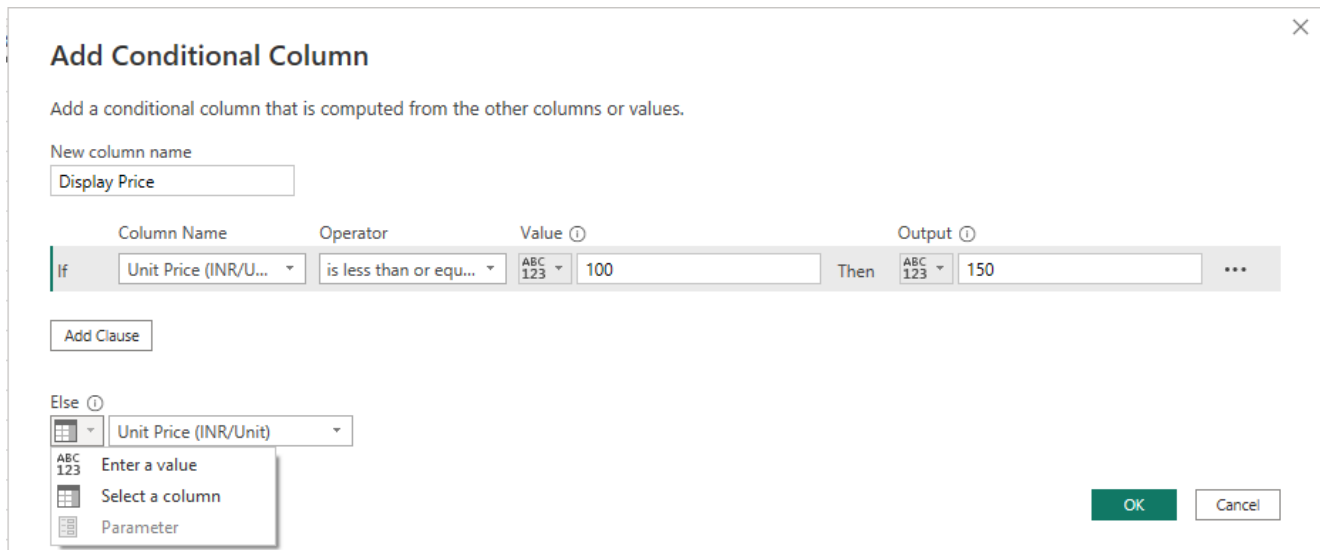

Adding a Conditional Column

On the Add column tab, in the General group, there is Conditional column command.

Here, we are targeting the “Unit Price (INR/Unit)” column from the Data Table to create a conditional column “Display Price”. The condition is, if the Unit Price is less than or equal to 100, we will set the Unit Price as 150 else the original price would be unchanged, and all the changed or unchanged values would be inserted into the “Display Price” column respectively.

The output of the query will add the conditional column.

File	Home	Transform	Add Column	View	Tools	Help
Column From Examples	Custom Column	Invoke Custom Function	Conditional Column	Index Column	Duplicate Column	General
Format	Parse	From Text	Merge Columns	Extract	Statistics	Standard Scientific
Trigonometry	Rounding	Information	Date	Time	Duration	Text Analytics
Vision	Azure Machine Learning	AI Insights				

Queries [1]

SLS Order Details_Master

Table.AddColumn(#"Changed Type", "Display Price", each if [#"Unit Price (INR/Unit)"] <= 100 then 150 else

ate (dd-mm-yyyy)	A _C Date of material receipt (dd-mm-yyyy)	A _C Authorised signatory from Standard Library Service	ABC ₁₂₃ Display Price
1			192
2			300
3			150
4			250
5			150
6	-	-	400
7			150
8			7500
9			450
10			260
11	-	-	Error
12			250
13			250
14	-	-	150
15			3350
16			5150
17			2025
18			305
19			150
20			150
21			150
22			150
23			160
24			

Adding a Column by Incorporating Multiple Conditions

Now let’s add another conditional column named “Final Price”, that will contain the “Unit Price (INR/Unit)” column value, if it is less than or equal to 200, set it to 500. Else if it is greater than or equal to 500, Store the Unit Price. However, the figure from the “Total Price (INR)” column will be the Output if none of the earlier tests returned a positive result.

Add Conditional Column

Add a conditional column that is computed from the other columns or values.

New column name

Final Price

Column Name

Operator

Value

Output

If

Unit Price (INR/U...

is less than or equ...

ABC₁₂₃ 200

Then

ABC₁₂₃ 500

Else If

Unit Price (INR/U...

is greater than or...

ABC₁₂₃ 500

Then

Unit Price (INR/Unit)

...

Add Clause

Else

Total amount (INR)

OK

Cancel

The output of the query will add the conditional column.
